Updating the Slow Dough Website

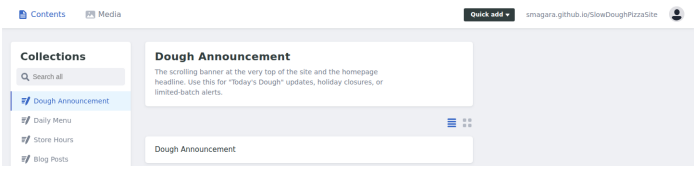

A quick guide to editing the Daily Menu, Blog posts, and the Dough Announcement banner yourself — no developer needed.

1. Open the editor

Go to **https://smagara.github.io/SlowDoughPizzaSite/admin/** in any browser (bookmark it — it isn't linked from the website). Click **Login with GitHub** and sign in with your GitHub account (the same one your web developer added to the site as a collaborator); a small GitHub window opens, asks you to approve “Slow Dough Content Admin” the first time, and closes by itself. You stay signed in on that device.

The sign-in screen.

After signing in, pick what to edit on the left.

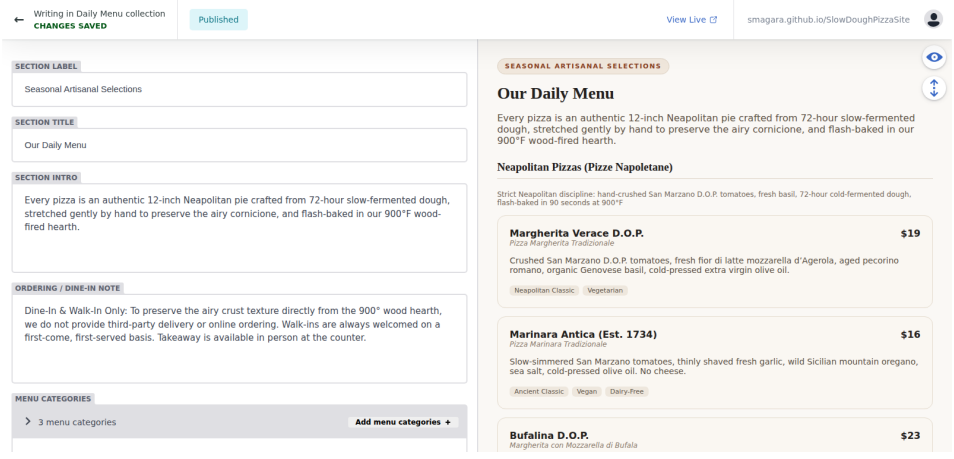

2. Choose what to update

On the left you'll see four areas you can manage:

- **Dough Announcement** — The dark banner at the top of the site and the homepage headline.
- **Daily Menu** — Pizzas, small plates, drinks, prices, and descriptions.
- **Store Hours** — Weekly hours and the holiday/closure notes.
- **Blog Posts** — Articles shown in “The Baker's Journal.”

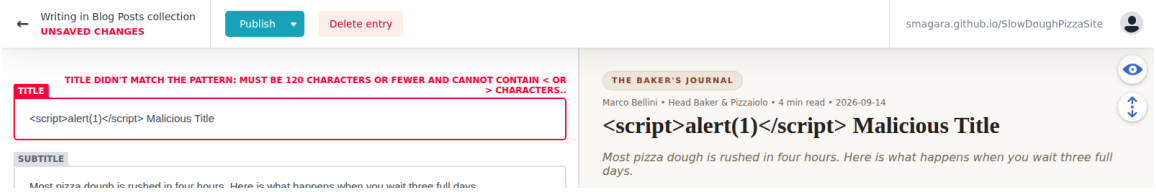

3. Make your edit

Click into any field and type your change — for example, updating a pizza's price or description. The right-hand side shows a live preview that looks just like the real website, so you can check your change before saving.

Editing the Daily Menu: fields on the left, live preview on the right.

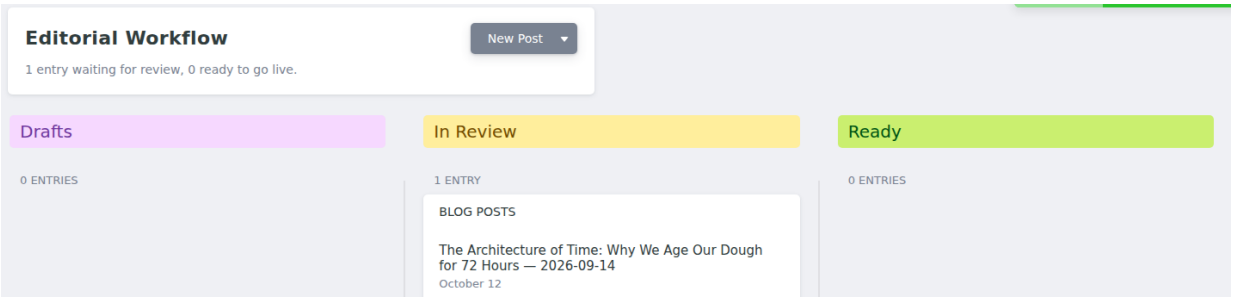

A note on typing special text: please don't paste in raw HTML or code snippets (e.g. anything starting with <script>). The editor will show a red warning and block saving if it detects this — that's expected, just remove it and use plain text or the formatting buttons (bold, italic, bullet points) instead.

Example: the editor blocking a pasted script tag with a clear red warning.

4. Save & publish your change

Click **Save**, then use the **Publish** button. Your change does **not** go live immediately — it's sent off for a quick review first, the same way a second pair of eyes checks things before they go out. You'll see its status change from **Draft** → **In review** → **Ready**.

The Editorial Workflow board: see everything waiting on review at a glance.

What happens behind the scenes?

Your edit is automatically turned into a “Pull Request” on GitHub — think of it as a clearly marked, reversible change request. Once it's reviewed and approved, the website automatically rebuilds and your update goes live — usually within a couple of minutes, with no extra steps for you.

5. Good to know

Who can make changes?	Only the GitHub accounts your developer has added as collaborators on the website's repository. Nobody else can sign in, even if they find the /admin link.
Can I undo a mistake?	Yes — every change is reviewed before it goes live, and the full history of edits is kept forever, so anything can be reverted.
Do I need to tell anyone I made a change?	If a reviewer is set up on your team, they'll see the pending change automatically and can approve it. Otherwise, check back on the status in the editor.
What if I just want to test things?	Ask your developer about “local preview mode” — a no-risk way to practice edits on their computer before touching the live site.

Questions or something looks wrong? Contact your website developer/engineering contact before making further changes.
